Photoshop also has a tool that enables you to add a digital "loop" to a selected area. The Floppy Dial (figure 7.36) enables you to dial into the images and select a portion to be transformed. It has both horizontal and vertical options and can create interesting effects (figure 7.37). If you don't want to transform the image, you can just select the area of the image you want to alter and press Delete. Figure

Adobe Photoshop Elements has a preset template, i.e. a new image that already has its dimensions and all your predefined settings. You can use this preset image to create a new image. Type of image, DPI, size of the image, and any other information you want to add to your image can be found under the Settings. If you don't want to use the preset image, type of image, and size and DPI information, you can skip those steps.

Otherwise, you can skip these steps by typing "Finished." 3. Choose the type of image you want to use Choose the type of image you want to use. In Photoshop Elements 2019, go to File > New. Aberrant oxidative stress and compromised physical fitness contribute to the etiology of metabolic syndrome. At present, there are no data on dietary antioxidants or exercise interventions to prevent or treat MS in children. This study will examine whether administration of the antioxidant quercetin protects against oxidative stress, ameliorates the dyslipidemia, glucose metabolism, and adipose insulin resistance of an obesogenic diet. These studies will also determine whether the administration of quercetin with a low-calorie (900 kcal) exercise regimen prevents or reverses the dyslipidemia and insulin resistance of an obesogenic diet. In preliminary studies, we have demonstrated that childhood obesity is associated with an increase in plasma oxidized glutathione (GSSG), a product of oxidative stress, and an increase in lymphocyte and monocyte oxidative susceptibility. In the present study, we have further demonstrated that an obesogenic diet increases oxidative stress in these cells. We propose that the reason that exercise has not been successful in reversing or preventing MS in children may be that physical activity does not "correct" the enhanced oxidative stress of the obesogenic diet. We propose that a combination of dietary antioxidant supplementation and aerobic exercise will decrease oxidative stress, improve lipid and glucose metabolism, and decrease insulin resistance in adolescents with obesity. This study will be the first to assess the combined effect of exercise and dietary antioxidants on oxidative stress, glucose metabolism, and adipose insulin resistance in obese children. The results will be used to direct future investigations with children and adolescents who are at risk for or have the disease. PUBLIC HEALTH RELEVANCE: The incidence of overweight/obesity has reached epidemic proportions in the pediatric population. The metabolic syndrome in children is
