While this can be done, I.FIG. 1 shows a circuit diagram of an example of a conventional switching power supply circuit. As shown in FIG. 1, a switching power supply circuit 1 includes a switching transistor Trs2 that controls a power current flowing through a primary coil Lo of an isolation transformer T1 by conducting and non-conducting at predetermined on-and-off times and outputs a rectangular waveform voltage from a secondary coil Lo'. The switching power supply circuit 1 further includes a voltage detection circuit 2 that detects a peak voltage of the rectangular waveform voltage outputted from the secondary coil Lo'. The voltage detection circuit 2 supplies a drive signal of switching transistor Trs2 to a base of the switching transistor Trs2 on the basis of the peak voltage detected. Further, the switching power supply circuit 1 includes an operation control circuit 3 that issues a signal of turn-on and turn-off of the switching transistor Trs2 to the voltage detection circuit 2. The operation control circuit 3 detects a load current flowing through a load Lo on the basis of a voltage supplied from the switching transistor Trs2 and outputs a driving signal. Further, the operation control circuit 3 detects a peak voltage supplied from the secondary coil Lo' and controls the switching transistor Trs2 based on the peak voltage. In the switching power supply circuit 1, the switching transistor Trs2 on and off is controlled by a timing pulse of a predetermined period supplied from the operation control circuit 3 and the power current flows through the primary coil Lo of the isolation transformer T1 in an on-state or an off-state of the switching transistor Trs2. Since the peak voltage of the rectangular waveform voltage outputted from the secondary coil Lo' is supplied from the voltage detection circuit 2 to the base of the switching transistor Trs2, and the switching transistor Trs2 is turned on and off at a timing of the peak voltage, an output voltage of the switching power supply circuit 1 is stabilized. In the switching power supply circuit 1, the switching transistor Trs2

NOD32 Anti-Virus.Q: How can a string be added to a dictionary? I'm learning python 3 and I don't know how to add a string of characters that is input by

the user to a dictionary.
I've tried something like
that `dictionary = {}` `first =`
`input("What is your name?`
`: ")` `second = input("What`
`is your second name? : ")`
`dictionary[first + " " +`
`second] = 0` But it doesn't
work. A: You need to
update your code like this :
`dictionary = {}` `first =`

```
input("What is your name?  
: ") second = input("What  
is your second name? : ")  
    dictionary[first] =  
dictionary[first] + [second]
```

This will do the trick. A:
Your approach would work
only if the keys of your
dictionary had nothing in
them when you try to add
the new element to the

dictionary. Using
dictionary[str1] = str2
